Lab Report Checklist

Use the following checklist, submitting a copy along with your report.

Final Check

- ✓ Do you have all of the basic components of your report in the correct order?
- ✓ Are all of your equations numbered and in the body of your report?
- ✓ Have any and all equations been removed from plots/figures?
- ✓ Do you discuss the equations you provide, introducing the variables in the equation and explaining how it is implemented?
- ✓ Do you provide all of the equations needed to extract out information from your data?
- ✓ Did you plot your data appropriately following graphing and data display best practices?
- ✓ Are your axes appropriately labeled?
- ✓ Does your graph contain data represented as points and fit modeling represented as a line?
- ✓ Is your graph easy to read?
- ✓ Did you import an image of your graph and not a screenshot?
- ✓ Is your graph properly labeled 'figure #'?
- ✓ Did you introduce your graph in the body of your report?
- ✓ Did you discuss the overlay of data and fit represented in your graph?
- ✓ Have you commented on the goodness of the fit overlay or highlighted any areas where the model and data differ?
- ✓ Did you present your final calculations in a table?
- ✓ Is your table numbered/labeled 'table #' and referenced in the body of your work?
- ✓ Does your table report average with error or fit measurement with error when appropriate?
- ✓ Do you discuss how the error was calculated (1-2 sentences stating where it came from)?
- ✓ Have you introduced any new ideas or conclusions in your conclusion section? These should go in the body.
- ✓ Did you briefly summarize major findings in your conclusion?
- ✓ Have you performed all stated activities and showed all findings as you specified in your abstract?
- ✓ Does your report have a cover page with your name and a title on it? This is just good practice.
- ✓ Did you make sure you can close and open your file and that the format and all details are contained in the file as you would like before uploading?

Excellent Work, nothing to add to this. A+

How to insert an equation into your work:

1. In the space below the sentence that introduces the equation, insert a table with 1 row and two columns.

The equation for a line was used in fitting where A corresponds to the slope, B corresponds to the intercept and the dependent variable is tracked using t while the independent variable is represented with x:

$t = Ax + B$	Eqn. 1
--------------	--------

2. Once you have inserted the equation and the equation number into the table, highlight the table and remove the borders.

The equation for a line was used in fitting where A corresponds to the slope, B corresponds to the intercept and the dependent variable is tracked using t while the independent variable is represented with x:

$$t = Ax + B$$

Eqn. 1

3. If you struggle to remove the borders in Word, google “how to remove borders from table in WORD”.
