

STOP DOING APRILTAGS

- Things that look like QR Codes are supposed to have **DATA**
- **YEARS OF DEVELOPMENT** yet **NO REAL-WORLD USE FOUND FOR detecting at more than 30fps**
- Wanted to know where you were? We had a tool for that:
It was called subtracting where you are from where you aren't
- “i am using iterative path compression for connected components so you technically can't prove this code is correct” – Statements dreamed up by evil wizards

LOOK at what UMich has been demanding your respect for all this time, with all the cameras & coprocessors we built for them

(This is REAL CV, done by REAL engineers)

?????

????????

????????????????????

They have played us for absolute fools
